How to Install Measure at Home

You may be wondering: how do I get set up to use Measure Premier at home?

You can have Measure on as many computers as you need; just remember concurrent use is limited to the number of subscriptions. We wanted to take the opportunity to explain how to put Measure on additional computers.

- Make sure to close Measure Premier on your office computer — this will release the licence so you can use it at home.

- To download and install Measure on additional computers; please **click here** for the download file and follow the onscreen instructions.

Download and install Measure setup file

- Measure v.15.0 Setup File

Please view System Requirements for Measure **click here**.

If you need assistance, just let us know.

- Once Measure Premier is installed, you'll be asked to sign in. If you're not sure what your username and password are, your Admin user will be able to help; if not, reach out to us.

- After signing in, you may notice that your settings and products have reverted to the factory defaults. An easy way to restore your setup is to open a recent project (you may wish to email one to yourself before leaving the office), go to the product list (F3), and click "save as default" in the bottom-right corner. This will set the products/settings of that project as the default setup on your home computer.
